

The basic idea of the installation is to pay people's attention to alternative and renewable energy sources and show their importance and stages of development!

Piezo electric generator

In this conceptual project used method of energy generation by the people -piezoelectric generators. They converts mechanic impulses into electrical energy.

Generators can be inserted under the walkway and partly open under the glass surface (to interested people visually) Piezoelectric generators can interact with outhr systems of producing energy.

Walking people will produce electricity that later can be used to working of street lanterns and also to charge different devices like mobile phones or laptop and wifi.

From this center pavilion people can see more infrastructure around them. Spiral visually open when the people climbed to the top of the cylinder pavillion. They can also charge their devises by the energy they generate

In the center of the spiral, people understand that the most progressive source of energy is themselves. Mechanical influences of the foot on the surface of the track.
