

# inhabitable remediation machine

SUPPORTING BUILDINGS BECOME COVERED BY REMEDIATED SOIL

SITE BEGINS TO OPEN UP AS PODS LEAVE INFRASTRUCTURE

**MONITOR**  
A variety of toolings allow the monitor to collect data about the status of the remedial plants, as well as deliver nutrients which increase contaminant uptake.

**INFILL**  
After each pod completes a remediation cycle, the gantry carries it to the outside of the retention wall, where the clean soil is deposited and the landscape begins to be built up.

**AERATION + REPLANTING**  
Auger attachment for gantry aerates soil between plantings to ensure full remediation.
