Agricultural micro surface for Refshaleøen

Along the slopes of the hill there is a grid of paths and areas designated to be cultivated to create an urban garden for people of the district and to offer a panoramic view on the town and the sea. Different odds allow you to have different views of the city and the hill context also being carried out with different curvatures and angles that require different exposures of the sun.

The materials used are: sheets metal recycled from obsolete ships for the structure, organic soil for the hill, strips of recycled woods for panoramic paths and concrete for the boundaries of the green areas.
