

FUN ENERGY

HOW MUCH CAN WE GET FROM YOU

Sustainability, green energy and waste-free are topics that currently concern our society and inspire urban art. The challenge is to construct a work of art capable of producing clean energy to power the European Green Capital 2015, Copenhagen. With this proposal we intend to go beyond the objective pursued. Taking advantage of natural elements (water, sunlight, wind, etc.) as sources of energy is a well-known strategy with proven efficacy, but art has the duty to be at the vanguard, to be capable of criticizing the existing solutions and seek further, launching innovative concepts and inspir-

ing novel experimental technologies. In this regard, this project seeks to sensitize the citizens of Copenhagen to a poorly explored source of energy. This source is its own inhabitants.

A human being releases big amounts of energy in its daily movements. In each and every step, every gesture, every movement, we produce energy that can be reused to sustain our own needs. Why not take advantage of this energy?

Why not envision a future where human energy is exploitable?
