

THE GREEN WAVE

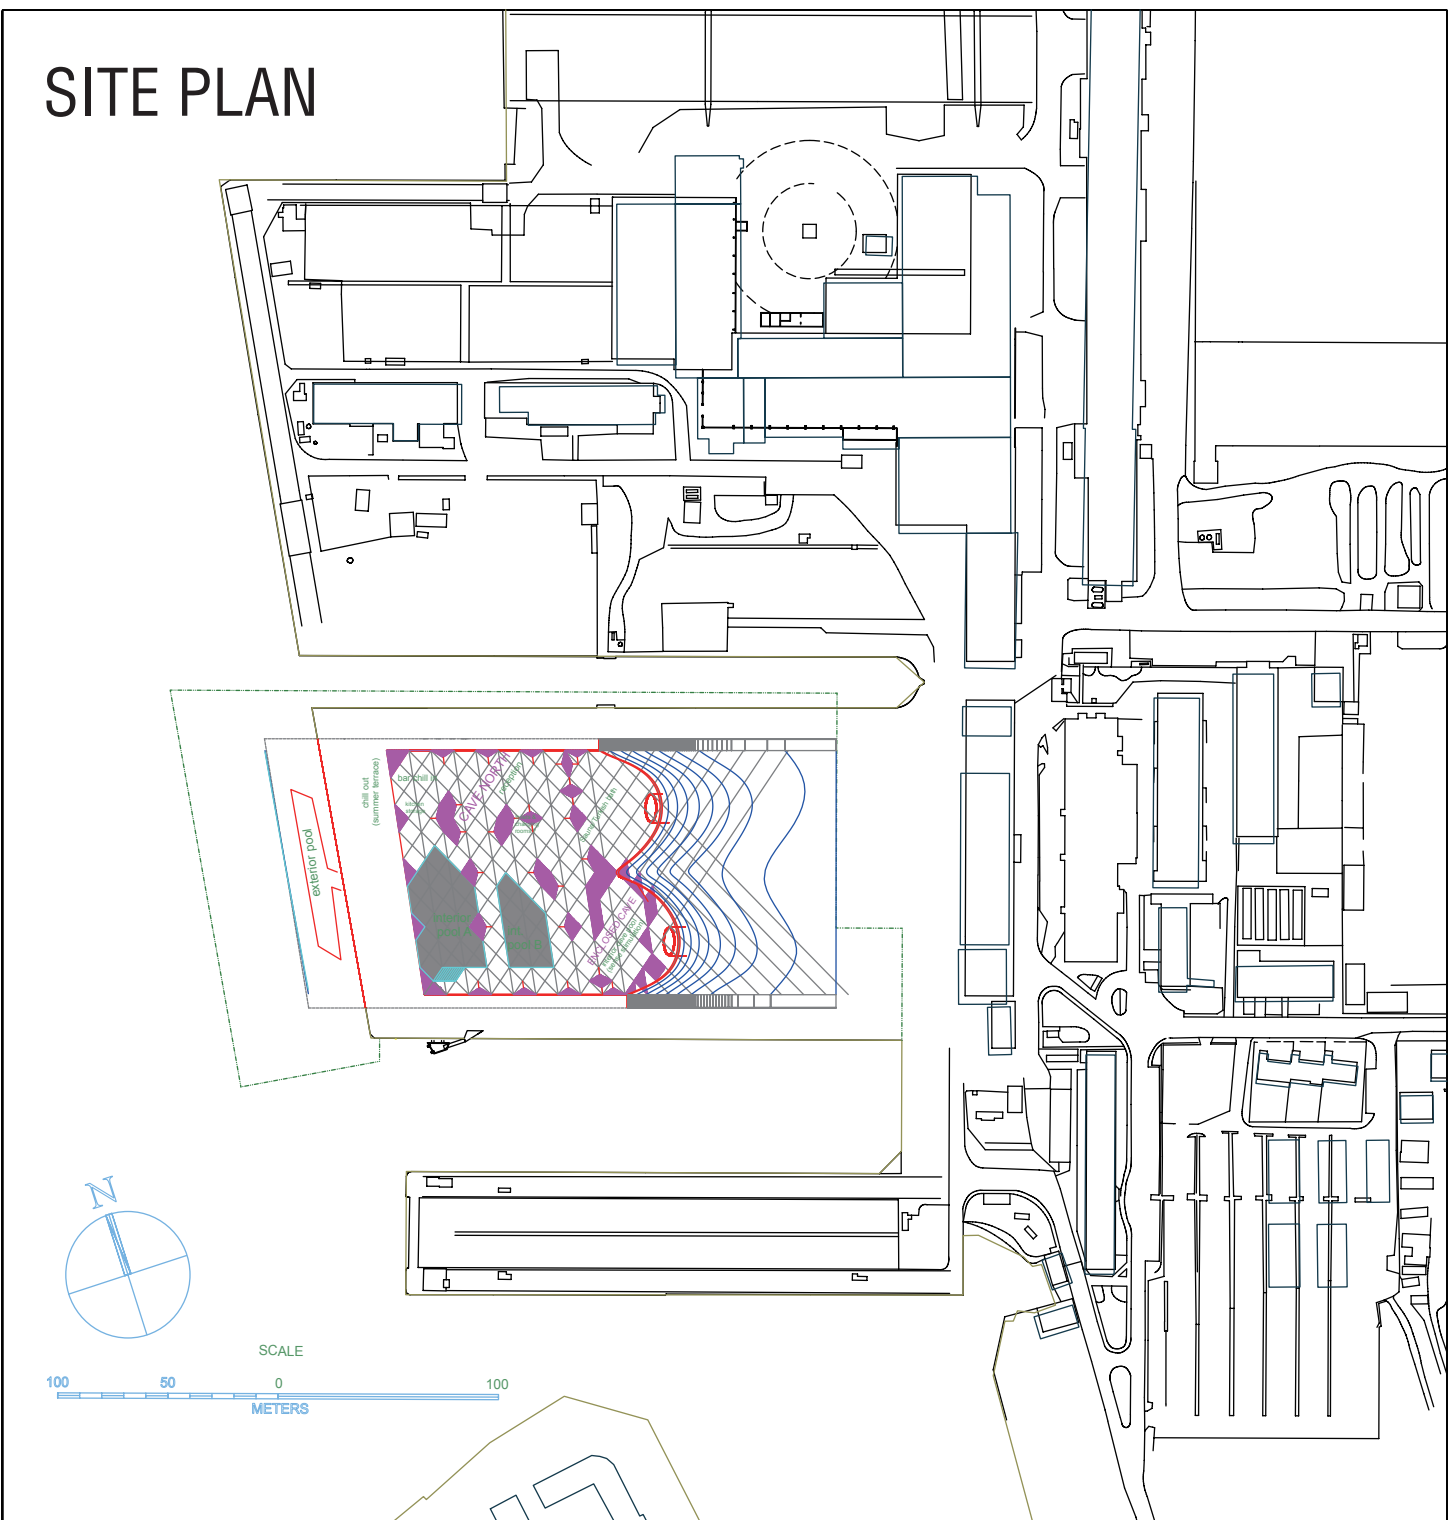

The “Green Wave” is a symbolic piece at the first level. It takes advantage of the privileged situation of the project as a background of a national touristic attraction with the “little mermaid” on the other shore, and thousands of tourists picturing her in their visit to the city.

The “Green Wave” will recreate temporary waterfall event as a background for the “little mermaid” and for all those tourists on the other side with their cameras, to increase the awareness of the conscience and importance of the green power in the present and near future for the whole humankind. And in this way, the “green wave” is a representation of what the renewable energies will bring into our lives soon,... the green wave is coming!

On the other hand, the green wave is a topographic event in the amazingly flat surface of the land at reffefeston?? specifically, and on Denmark in the general . The green surface will cover the energy production machinery generating an accessible and functional rooftop that connects the level of the natural ground in the industrial area with the higher position of the waterfall apparatus around 35 meters height. This elevated condition will give the visitors the possibility to enjoy a very nice panoramic viewpoint facing Copenhagen from a new perspective.
