

floating FOREST₂

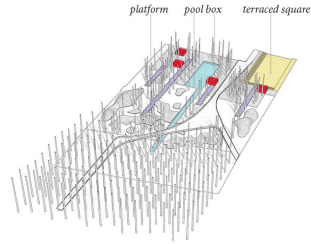

Thematic areas in the park

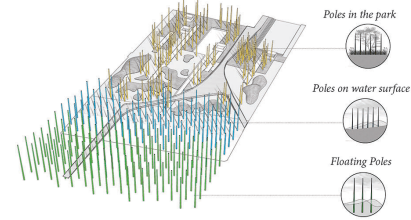

the green in the park

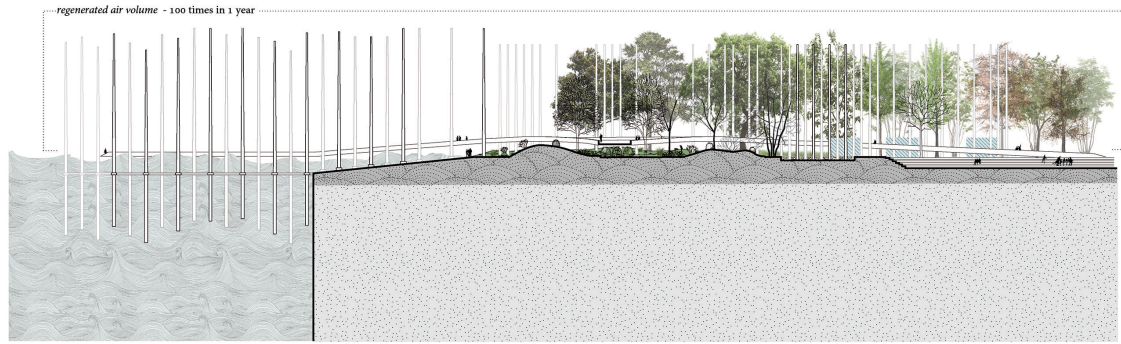

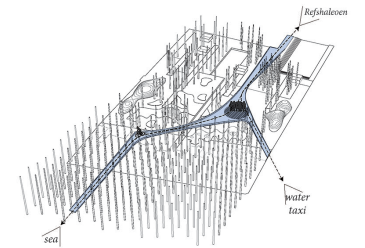

The elements of park

The "forest" - Poles

The suspended path - a new urban connection

Longitudinal section

For the realization of the Park the bank soil is remodelled and reclaimed from the existing polluted soil. The Park is composed by natural and artificial elements. A big green lung in north-east of the site, composed by trees which are able to clean the air and create shaded areas. A suspended path runs along all the area, linking the water taxi stop at the rest of the neighbourhood. This path overlooks the sea to regain the relationship with water. There are different thematic areas in the new park, at different levels. Natural areas, like sand dunes, green dunes, thematic rooms (urban gardens) and artificial elements like the suspended path and the terraced square for outdoor events. An artificial pool, cropped from the existing bank permits to play water sport and open air activity. A series of artificial poles, generated from a regular grid, gives a proportion to this oversized space and accumulate energy (produced by the water floating poles) working as big batteries (accumulators and distributors of energy).
