

THE LANDART

The design reaches out to create a sensual experience from afar by the visual presence of the installation as a new landmark in the Copenhagen urban landscape.

THE KYST is lit up as the night falls. The intensity of the glowing is influenced by the amount of harvested energy during the day. After a stormy day the integrated LED-system emits light throughout the night, while the nocturnal illumination would fade away after a few hours on a calm day.

In accordance to Denmark's long dark winters the illuminated sculptural landscape will not only draw attention to the local climatic conditions but also give possibility to physically experience green energy in combination with contemporary land art. Just like one of the elemental forces, the visitor as an interacting element contributes to the power output. By the possibility of the immediate physical interaction the installation raises awareness on clean energy production and the potential of the beauty that lies within this cultural achievement.
