

FUN ENERGY

HOW MUCH CAN WE GET FROM YOU

The concept is simple. Five giant inflatable playgrounds are built. Each shape derives from a hyperbolic geometry, which gives us formal richness and diversity of spaces. The form itself inspires the curious side of the observer. Prompts us to cross it and discover it. And while exploring it we are also freeing our movements, by climbing, jumping, sliding, etc... The object provides a space that is propitious to eamusement. The design of cities responds to the needs of a cosmopolitan life based in routines and programmed movements, restricting people from moving freely and limiting spontaneous interactions. This object at-

tracts people that need to break with their urban routines, to relax, to find a space to escape and play with others in groups. It is needless to point out the advantages of group play. Besides the health benefits, the adrenaline produced render our minds more flexible and encourages us to interact and create social bonds. The project reaches a different level of sustainability, a social sustainability. The art object works as a tie between the city's inhabitants. On the other hand, it would be fantastic if all of the energy expended in these objects could be retained and re-used to meet the needs of its users.
